

Cost per MW

The graph lists five values for each generator Project (each in dollars/MW):

- The estimated cost of the projects needed for generator-transmission interconnection [G-T]
- The estimated cost of projects needed for transmission Service [TSR]
- The estimated cost of projects to address pre-existing problems for each generator [G-T Pre-Existing]
- The estimated cost of other transmission projects already identified for other projects [Other TSR], and
- The estimated cost of other transmission projects already identified in the Ten Year Assessment [TYA].

The values were arrived at by taking cost and dividing it by the winter MW rating of the generator-transmission interconnection request to arrive at a cost per MW value.

Publicly posted ATC Planning studies were used as the starting point for collecting cost estimates and updated for those projects whose cost estimates have changed since posting of the relevant study.
